

Agenda

- Welcome to A-Frame NYC - Introduction & Definitions
- VR Market - Current Tools and Gadgets
- Retrospective on VR on the Web
- WebGL & WebVR & A-Frame
- Workshop Session
- Close up Session

Introduction to VR on the Web

VR Setup*

* Illustrations from Mozilla

VR Experiences

New considerations for VR app development

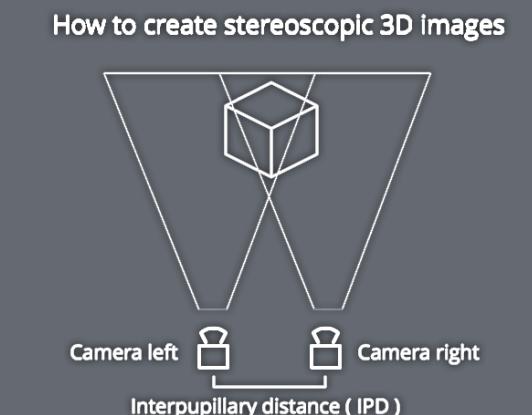

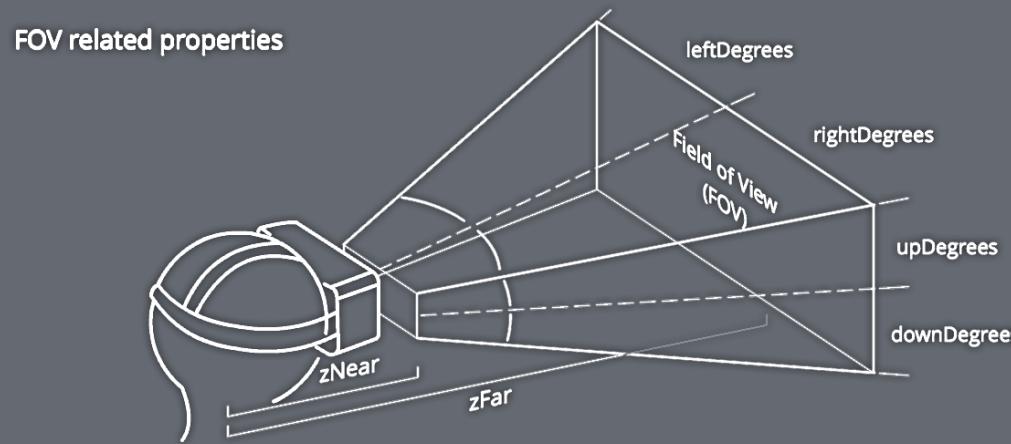

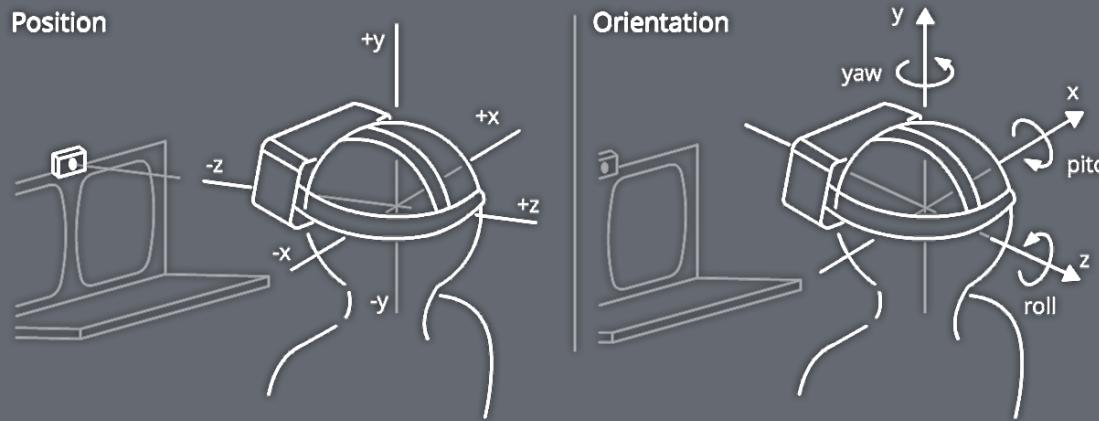

Focus on User Experience

- Stereoscopic vision & interpupillary distance (IPD)
- Head tracking & degrees of freedom (DoF)
- Cone of focus & field of view (FOV)
- 3D positional audio
- Latency & frame rate (frames per second / FPS)

Focus on User Comfort

- Eye strain
- Motion sickness

Degrees of Freedom, Stereoscopic Vision & Interpupillary Distance*

* Illustrations from Mozilla

Native VR Devices (PC & Console)

HTC Vive (room-scale VR), Oculus Rift, Playstation VR, Windows MR (Acer), Magic Leap, Fove, Razer OSVR

Mobile VR Devices (Smartphone)

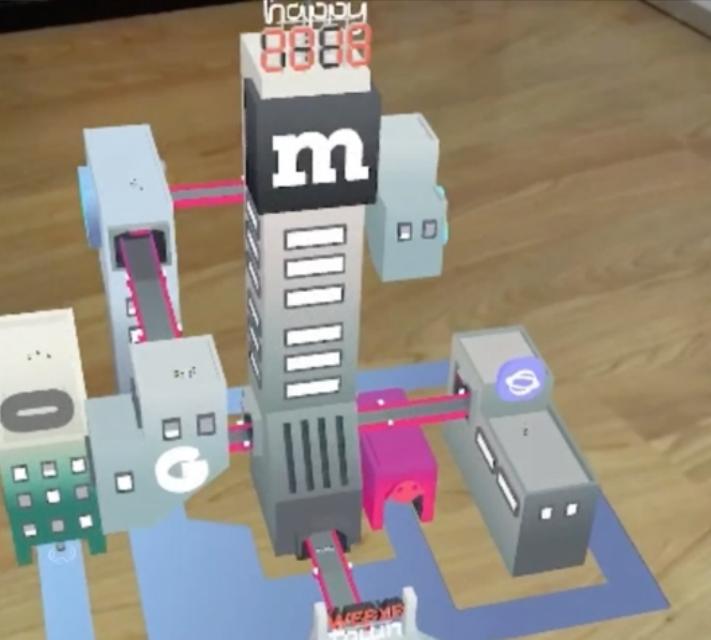

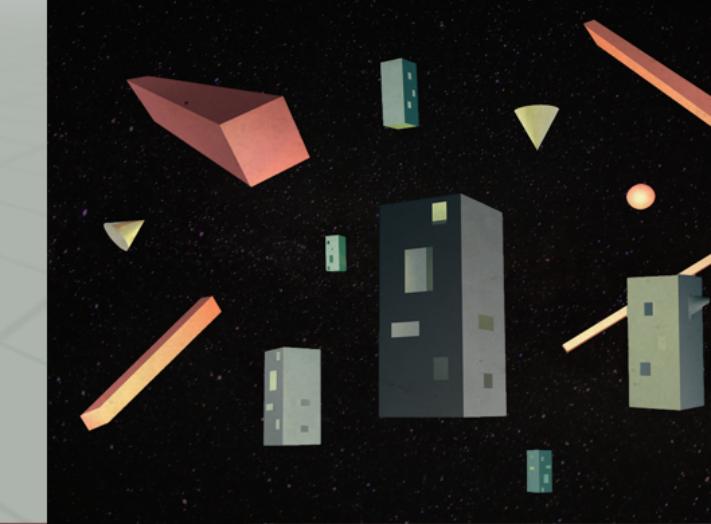

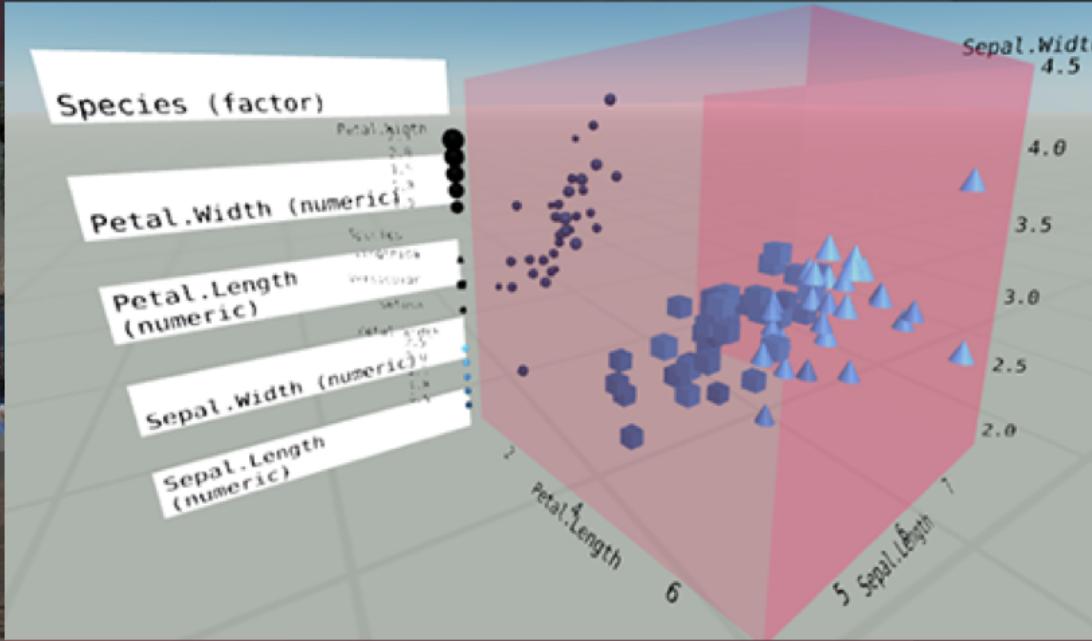

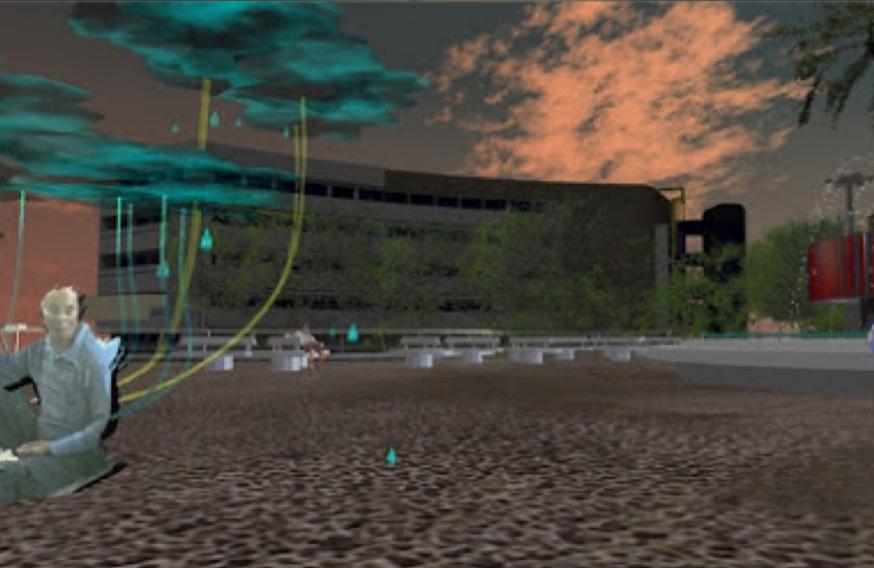

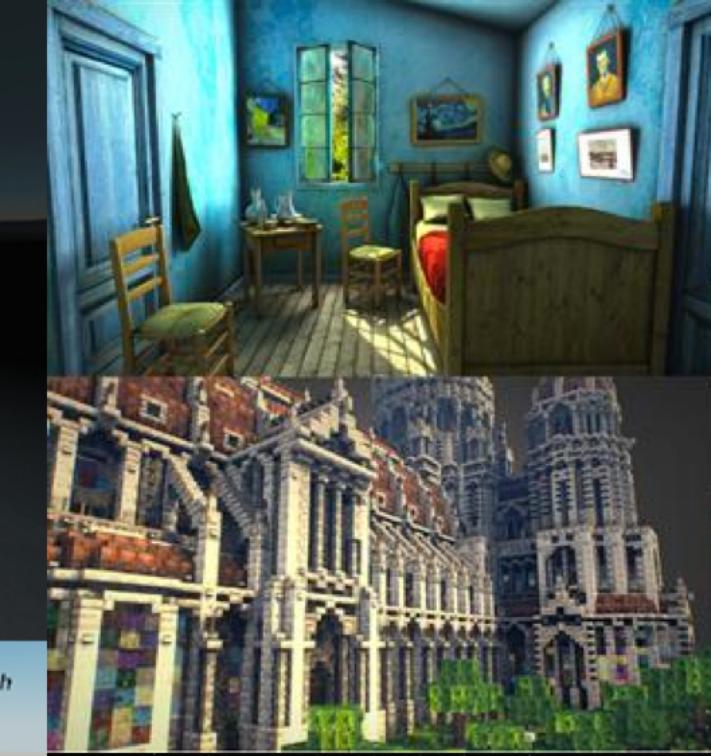

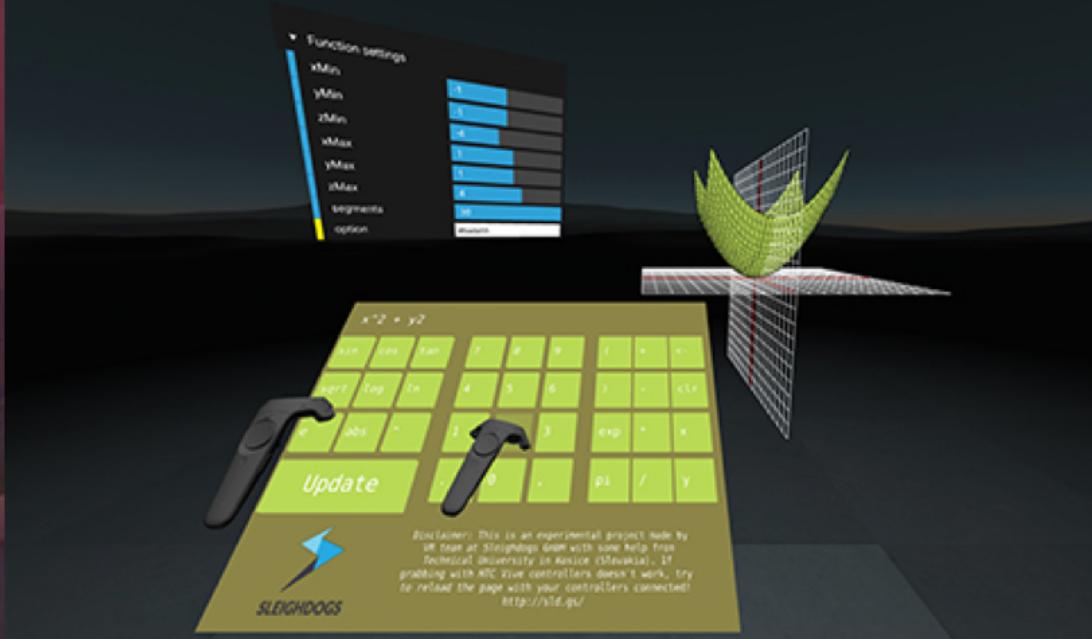

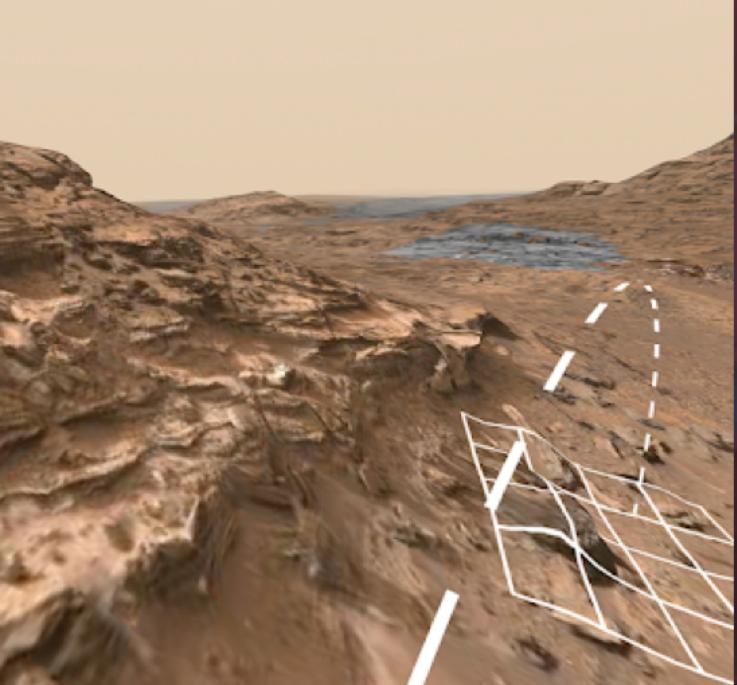

Samsung Gear VR
Daydream
Cardboard
Hundreds of third-party headsets

VR Programming

- Unreal Engine (C++)
- Unity (C#)
- Source Engine (C++)
- WebVR (WebXR Device API)

VR Distribution

- SteamVR
- Google Play
- Oculus Store
- The Rift Arcade
- V "open alternative" to SteamVR

Why WebVR?

- No app store ecosystem, distribution via internet
- Mobile & desktop automatically supported
- Uses current tools and libraries for JS
- Easy switch between VR & non-VR mode
- Interfacing with hardware through the browser

Progressive Enhancement by Arturo Paracuellos

Virtual Reality on the Web

A Retrospective 1/2

- 1994 VRML - first attempt to create an internet-based 3D language. (Mark Pesce presented the Labyrinth demo he developed with Tony Parisi and Peter Kennard.)
- VRML2 (1997) - added many features (animation) and later was succeeded by X3D
Problem of VRML: plugin-based technology that only came preinstalled on IE

Virtual Reality on the Web

A Retrospective 2/2

- 2003 OpenGL ES - cross-language and multi-platform 3D graphics API.
Hardware accelerated rendering of 3D objects.
- WebGL 1.0 introduced by Mozilla based on OpenGL ES uses DOM (canvas element)
- X3D (web3d.org) introduced **X3DOM**

Most popular WebGL Engines

- Three.js by Ricardo Cabello in 2010
- Babylon.js
- p5*js
- argon.js
- Scene.js
- Turbulenz

three.js

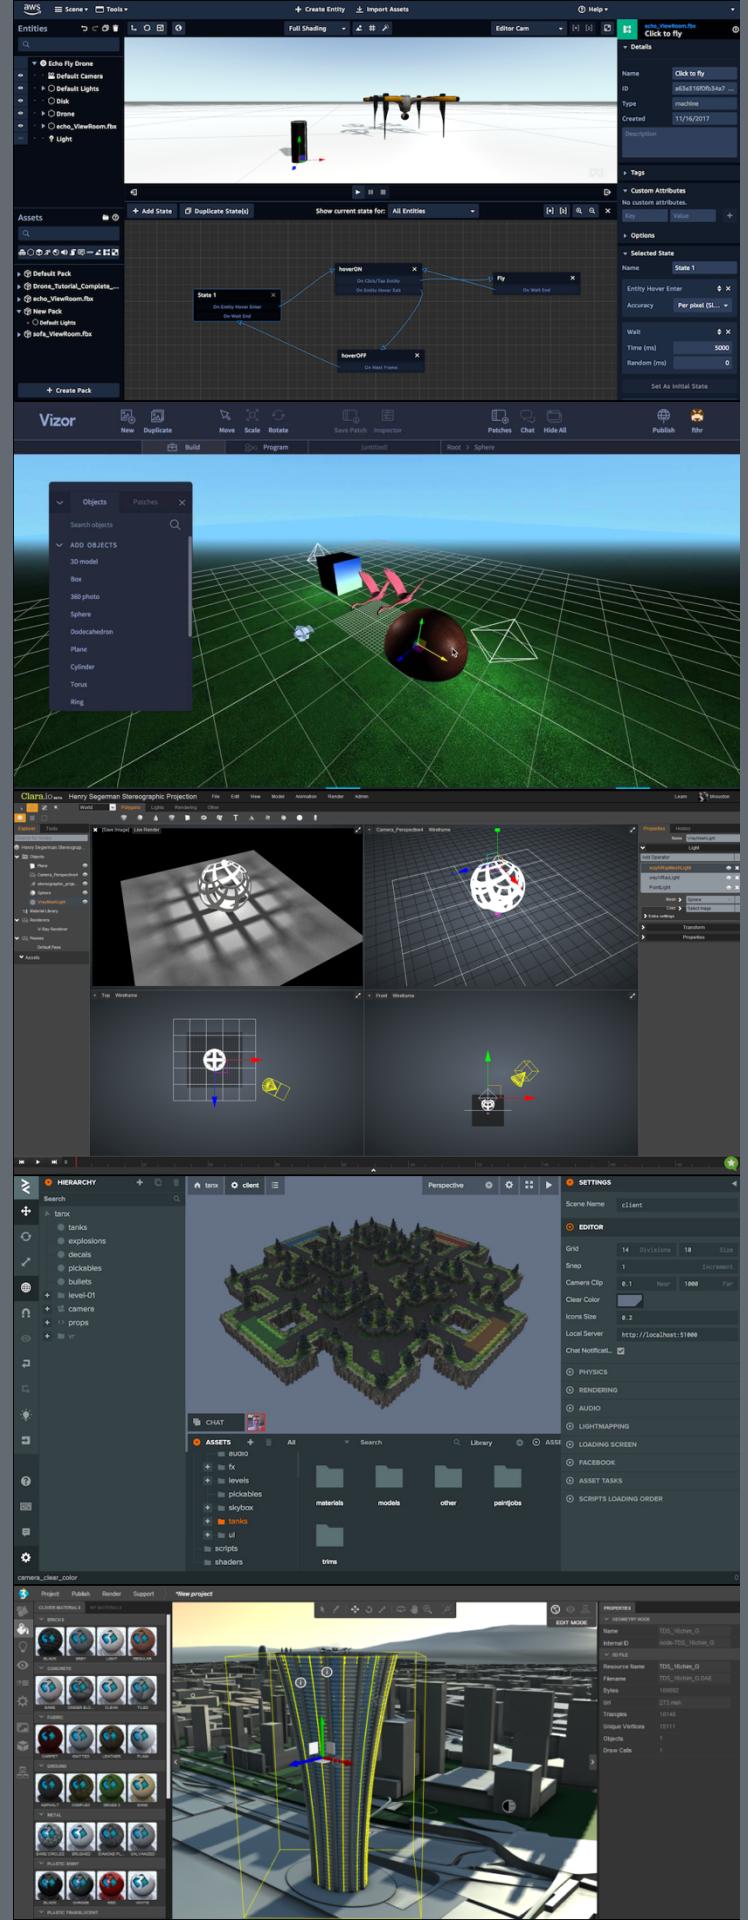

p5*js

WebGL Framework Comparison

What is WebVR?

WebVR is a *experimental* Javascript API that provides interfaces to VR hardware to allow developers to build compelling, comfortable VR experiences on the web.

WebVR

WebVR v1.1 (Legacy) Editor's Draft, 12/12/17

- deviceOrientation
- VRDisplay object handles almost everything
- available on multiple platforms

WebXR Device API (WebVR 2.0) Editor's Draft, 01/11/18

- not backwards compatible
- device support
- introduction of VRDevice & VRSession to replace VRDisplay
- read [Explainer doc!](#)

Goals of WebVR

- support for accessing virtual reality (VR) and augmented reality (AR) devices, including sensors and head-mounted displays, on the Web.
- Detect available virtual reality devices.
- Query the device's capabilities.
- Poll the device's position and orientation.
- Display imagery on the device at the appropriate frame rate.

Non-goals of WebVR

- Define how a virtual reality browser would work.
- Take full advantage of augmented reality devices.
- Build “The Metaverse.”

Check out <https://webvr.rocks/> for support updates

20         </a-scene>
21     </body>
22 </html>

```

A-Frame

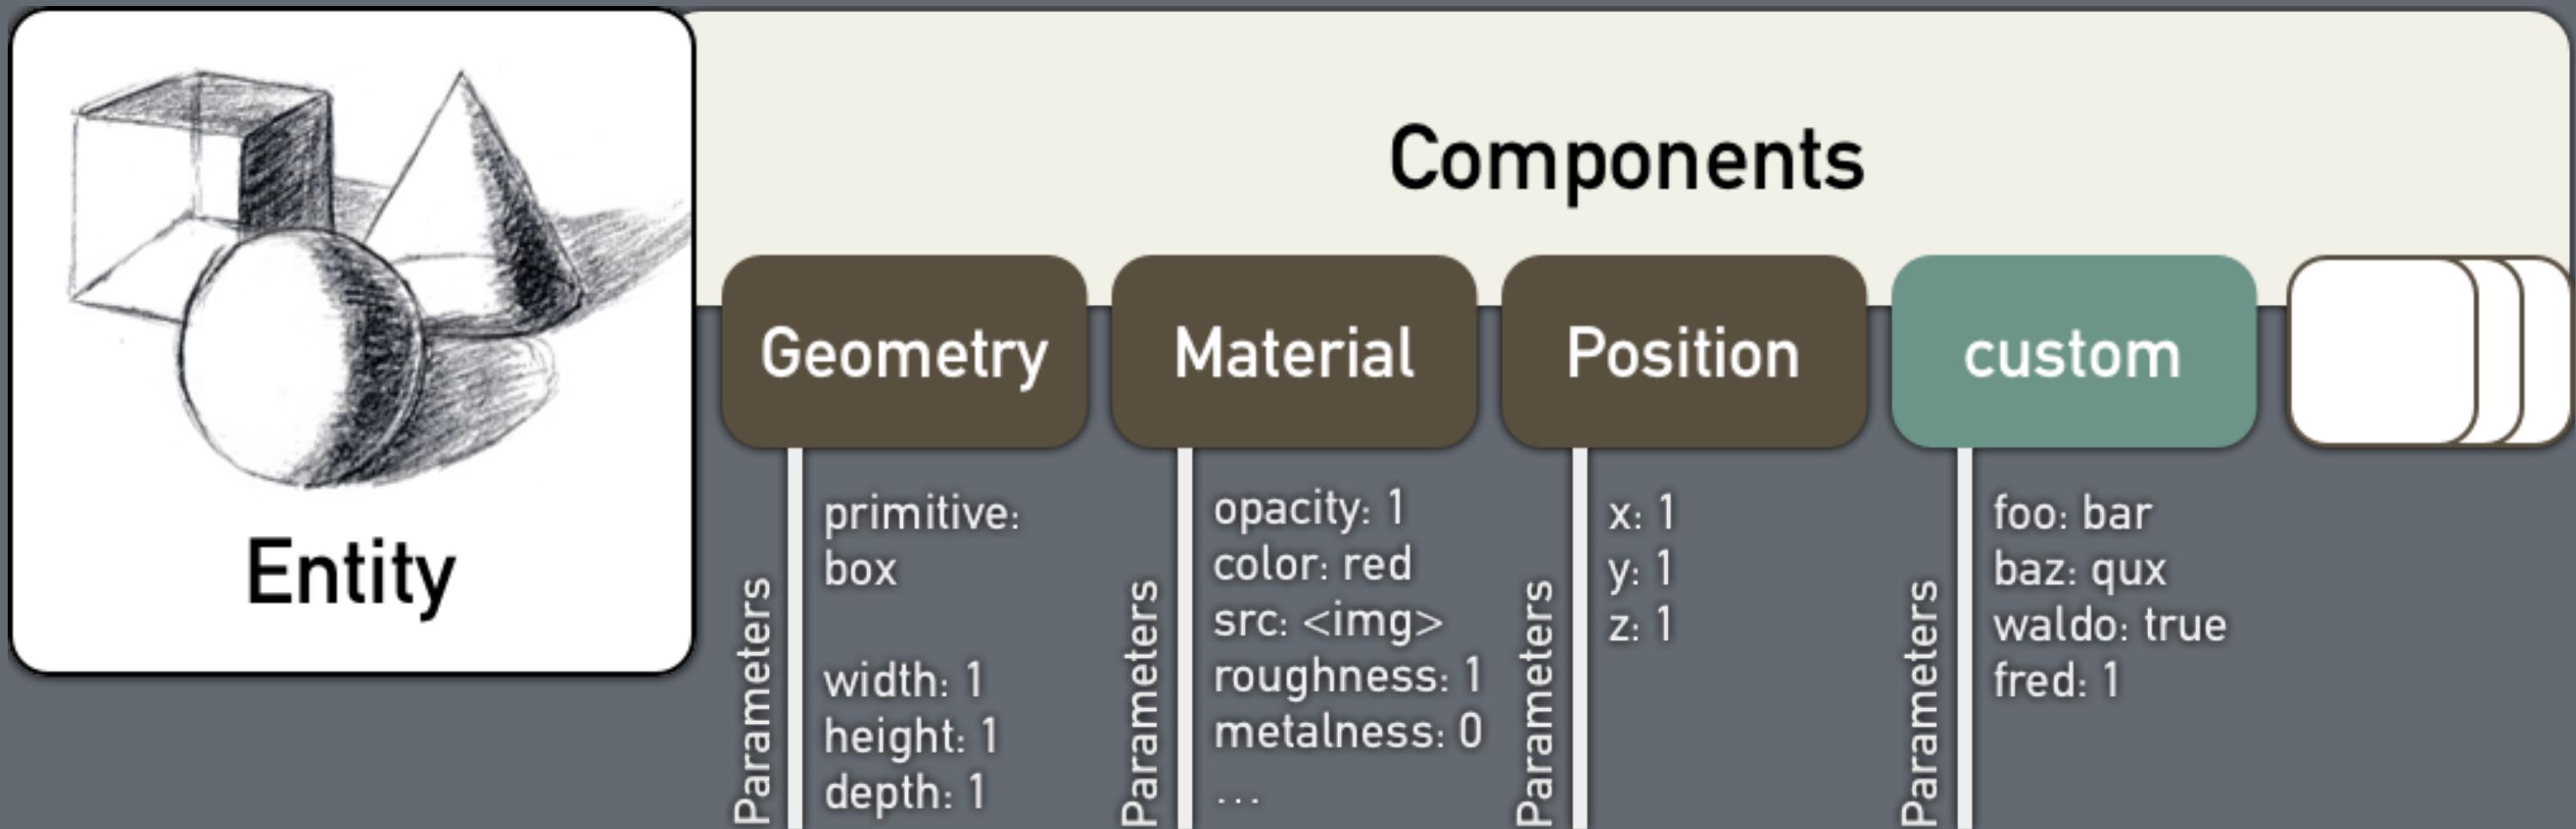

- a 3DML (3D markup language) like X3Dom and ReactVR
- DOM-based Entity-Component System => declarative & extensible (similar to Unity/UE4/PlayCanvas)

The A-Frame Stack:

A-Frame

Entity-Component System

A-Frame

- Entities are HTML elements (i.e., <a-entity>)
- Components are HTML attributes, set on the entity

```
<body>
  <a-scene>
    <a-entity geometry="primitive:box" material="color:#c00">
    </a-entity>
  </a-scene>
</body>
```

Entity

- general purpose objects (e.g. create a player, ball, or field)
- they inherently have a position, rotation and scale in a scene

```
<a-entity
  geometry="primitive:box;
    width:0.2;
    height:0.3;
    depth:0.5;"
  material="color:#c00"
  position="0 0 -1"
  rotation="0 30 30"
  material="color:#c00">
</a-entity>
```

Primitives (concise, semantic building blocks)

```
<a-entity geometry="primitive:box;  
          width:0.2;  
          height:0.3;  
          depth:0.5;"  
        material="color:#c00">  
</a-entity>  
  
<a-box width="0.2"  
      height="0.3"  
      depth="0.5"  
      material="color:#c00">  
</a-box>
```

Mixins

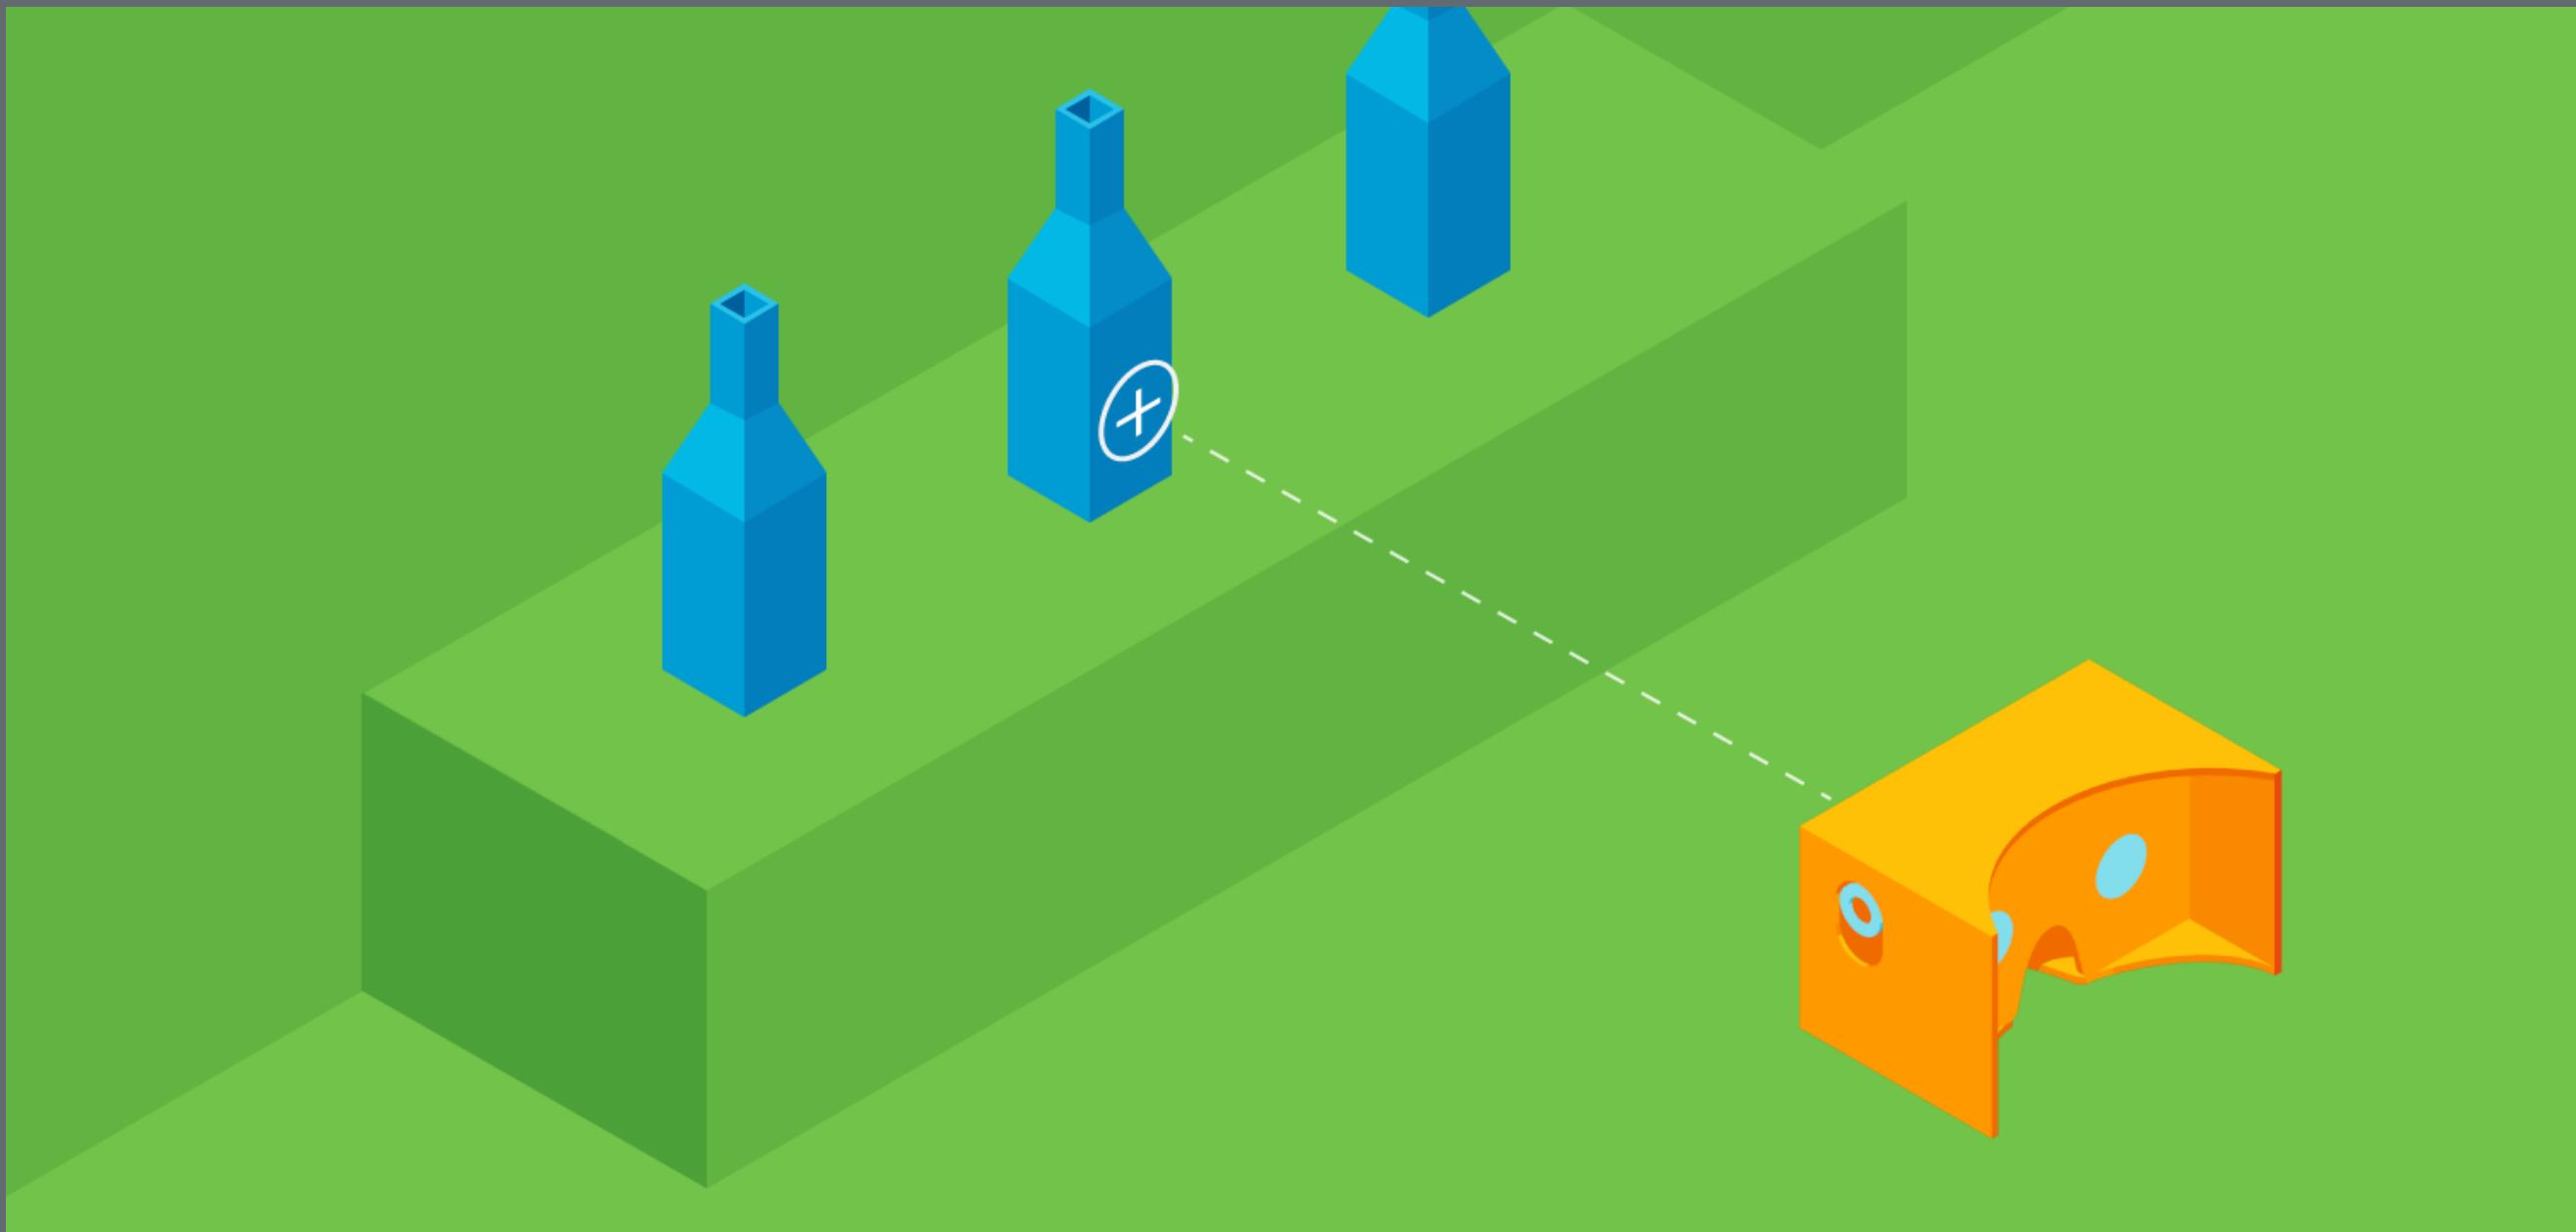

```
<a-mixin id="box"  
         geometry="primitive:box;  
                  width:0.2;  
                  height:0.3;  
                  depth:0.5;"  
         material="color:#c00">  
</a-mixin>
```

```
<a-entity mixin="box">  
</a-entity>
```

Custom Components

```
AFRAME.registerComponent('foo', {
  schema: {
    bar: {type: 'number'},
    baz: {type: 'string'}
  },
  init: function () {
    // Do something when component is plugged in.
  },
  update: function () {
    // Do something when component's data is updated.
  }
});
```

Gaze-Based Control

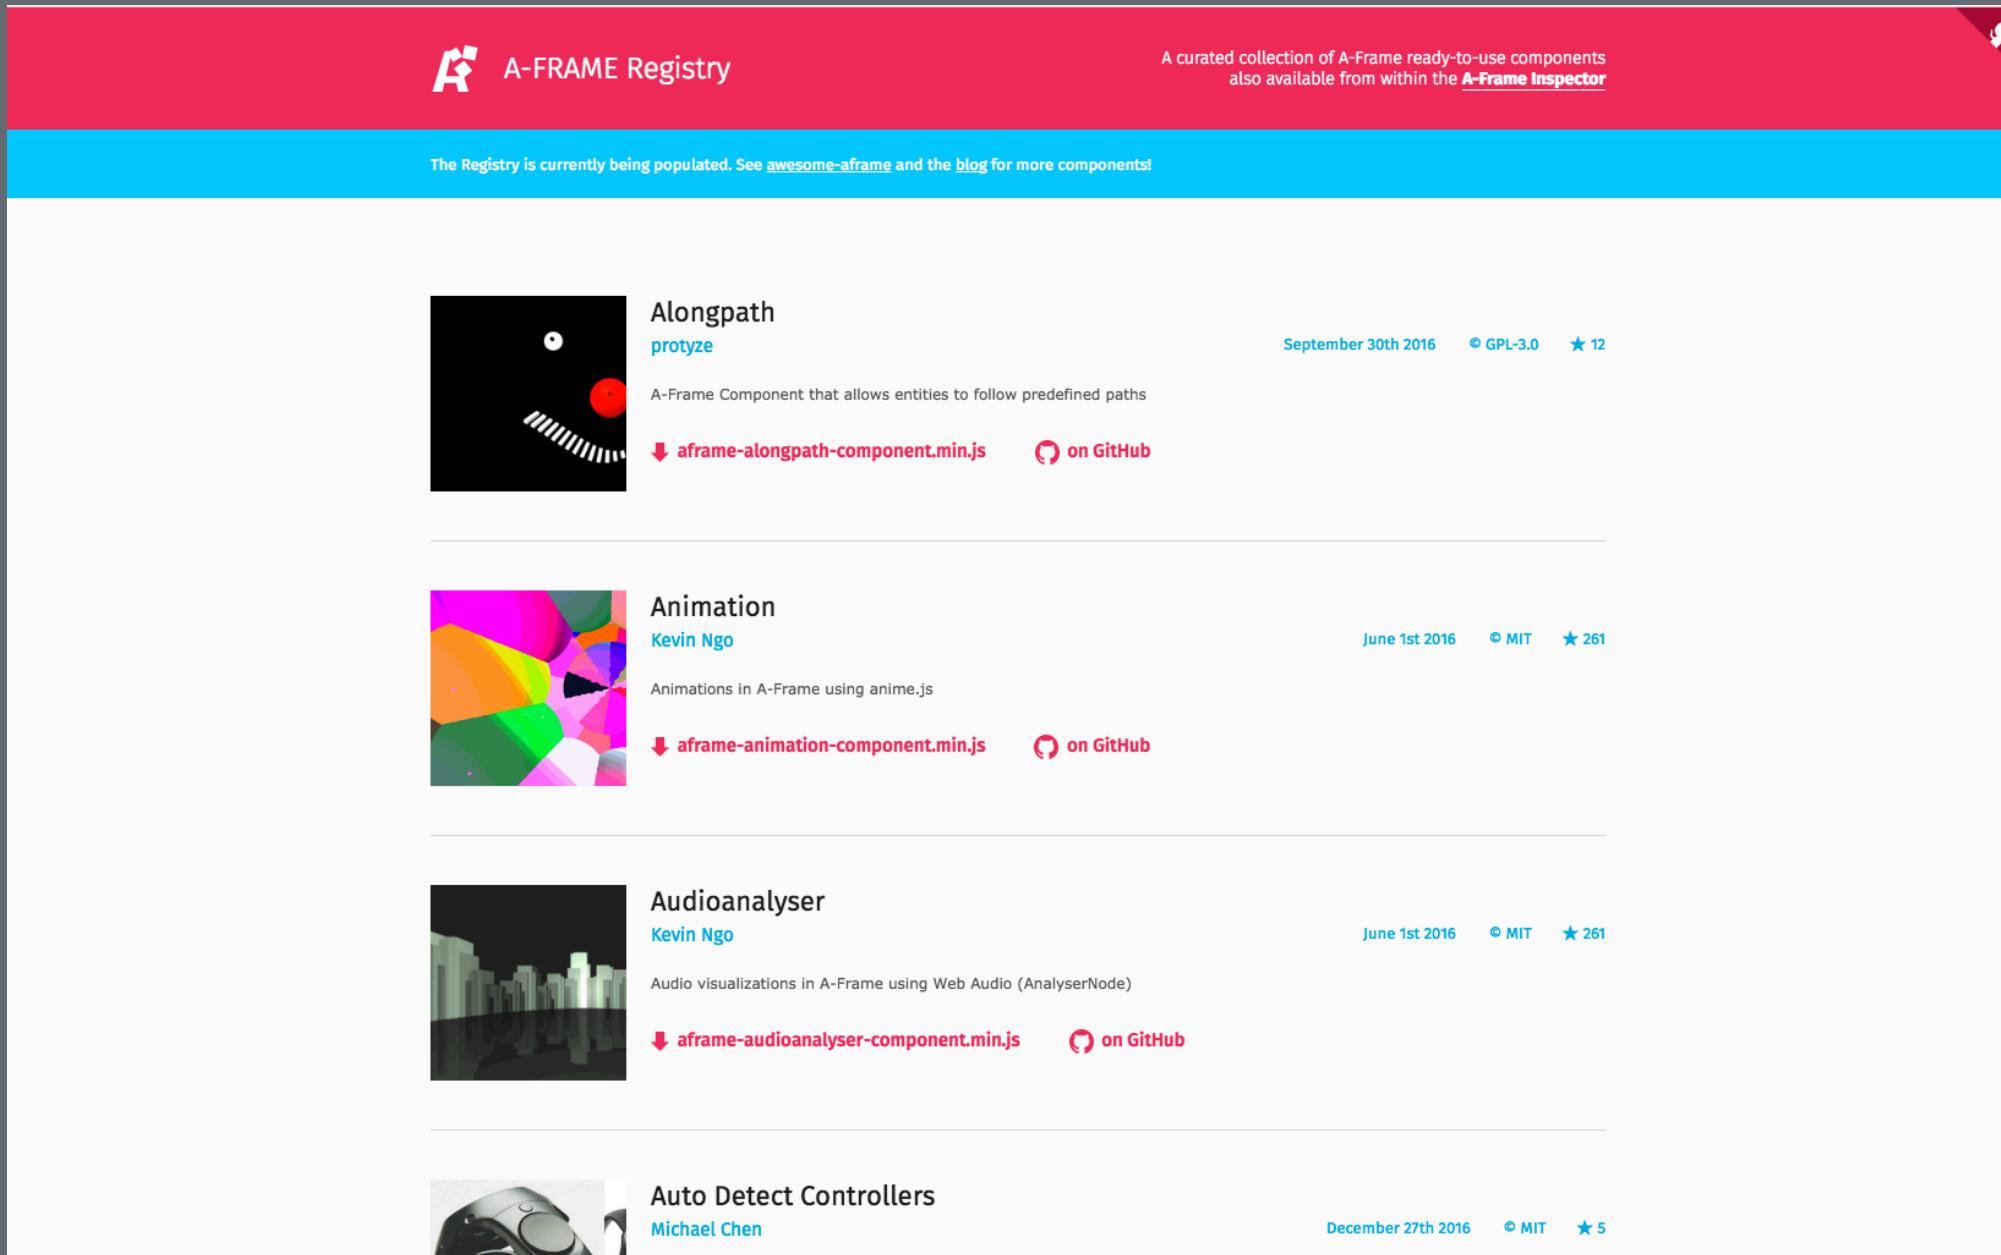

Gaze-Based Cursor Interactions

```
AFRAME.registerComponent('clickable', {
  init: function () {
    var el = this.el;
    el.addEventListener('mouseenter', function () {
      el.setAttribute('color', '#f00');
    });
    el.addEventListener('mouseleave', function () {
      el.setAttribute('color', '#fff');
    });
    el.addEventListener('click', function () {
      el.setAttribute('material', 'src', 'assets/football.png');
    });
  }
});

<a-sphere clickable src="assets/basketball.png" radius="0.5" color="#fff"></a-sphere>
<a-camera><a-cursor></a-cursor></a-camera>
```

[DOCS](#)[EXAMPLES](#)[BLOG](#)[COMMUNITY](#)[GITHUB](#)[SLACK](#)

VERSION 0.5.0

[INTRODUCTION](#)[Introduction](#)[Getting Started](#)[Device & Platform Support](#)[Best Practices](#)[FAQ](#)[GUIDES](#)[Building a Basic Scene](#)

A-Frame is a web framework for building virtual reality experiences. It was started by [Mozilla VR](#) to make [WebVR](#) content creation easier, faster, and more accessible.

A-Frame lets you build scenes with just [HTML](#) while having unlimited access to JavaScript, [three.js](#), and all existing Web APIs. A-Frame uses an **entity-component-system** pattern that promotes composition and extensibility. It is free and open source with a welcoming community and a thriving [ecosystem of tools and components](#).

<https://aframe.io/docs/0.7.0/>

HTML is one of the easiest languages to understand, and many of us are already familiar with it. There are no build steps or boilerplate required nor anything to install; all we need is an HTML file:

```
<html>
  <head>
    <script src="https://aframe.io/releases/0.5.0/aframe.min.js"></script>
  </head>
  <body>
    <a-scene>
      <a-box color="#6173F4" opacity="0.8" depth="2"></a-box>
      <a-sphere radius="2" src="texture.png" position="1 1 0"></a-sphere>
      <a-sky color="#ECECEC"></a-sky>
```

HTML

[Back to Scene](#)

The screenshot shows the A-Frame Inspector interface. At the top, there are various icons for scene management. On the right, the properties panel is open for a component named <a-sky>. The properties listed are:

ID	position	rotation	scale	visible	mixins
	0.000 0.000 0.000	0.000 0.000 0.000	-1.000 1.000 1.000	<input checked="" type="checkbox"/>	box <input type="button" value="+"/>

Below these, there are buttons for "Add component..." and "Copy Attributes". Under the "GEOMETRY" section, the primitive is set to "sphere". Other geometry-related properties include "buffer" (checked), "mergeTo", "skipCache" (unchecked), "radius" (5000.000), "phiLength" (360.000), "phiStart" (0.000), "thetaLength" (180.000), and "thetaStart" (0.000).

A large, semi-transparent white text overlay in the center of the screen reads "A-Frame Inspector [control]+[option]+[i]".

Create responsibly!

It's code time! Here's what we're building:

- github.com/roland-dubois/aframe-meetup-nyc
- XAMPP, MAMP or \$ python -m SimpleHTTPServer
- JSBin or Glitch
